KitKraken kitchen sink collection

One of the areas in which we are developing now is the manufacture of kitchen sinks. In our innovative collection of kitchen sinks (KitKraken brand), we have combined high quality and European design.

The concept of the new collection is based on the Scandinavian style, its simplicity and ergonomics, restrained style, conciseness of forms. The Scandinavian culture also inspired us to the name of the collection.

Alumarin - material used for the production of kitchen sinks KitKraken. The basis of Alumarin is a composition of polyester resins, modifiers, quartz sands, as well as fibers from fragments of aluminum filament, which makes the material resistant to constant shock loads and aggressive chemical environments.

About Design

In developing the design of sinks, key attention was paid to the "pains" of consumers. We explored user experience to identify the most important characteristics of a product, based on the Design Thinking concept. Sink constructions not only reflect today's interior trends: the collection design is more than practical.

All sinks (and their combinations) are functionally verified and are designed for different kitchens and different needs of the owners. As a result, it was possible to develop a unique shape of the kitchen sink, where the main highlight is the pentagonal bowl.

Distinctive features and features of the design concept

The highlight of the collection - the corner

The corner went to the basis of the development of the pentagonal bowl and is also repeated in the design of circular shapes of sinks from the collection.

Tap hole placement

The tap hole located in the sink edge (in polygonal sinks it is placed in the corner) provides the access to it in any 6me and can not be blocked with the dishes. Placing the plug holes in the fillets prevents them from being accidentally pushed and thus closed.

More user- inspired benefits

Thanks to the angular element, you can place big 32 cm diameter frying pans without removing a handle and dripping pans in the sink.

Clearly defined edges

This allows you to visually distinguish the collection from the typical smoothed models of sinks that are simpler and cheaper to manufacture.

Great depth of sinks

The depth of the main models is 21 cm, which is about 20% more than the standard sinks on the market

When developing the design of round sinks, we did without unnecessary parts of the body to maximize the capacity of the bowl.

Additional elements (drying, small bowl) are also inscribed in a circle and are installed in a separate unit, next to the main bowl.

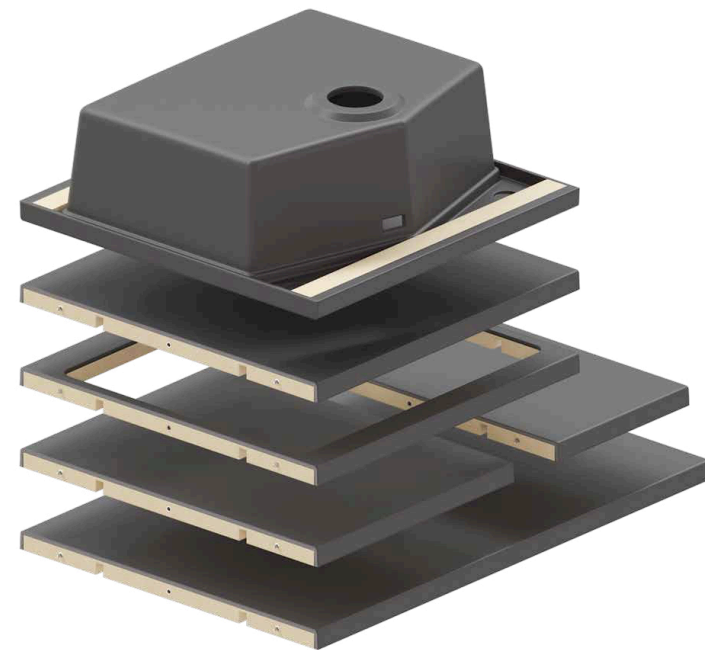

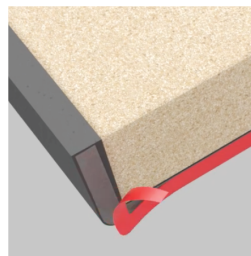

We also developed a cutting board for each of the sinks in the collection, which is used as a board and as a lid in case you have to postpone washing dishes.

KitKraken

Table top designer

There will be more KitKraken products in the future.
We are developing a prefabricated version of the countertops from prefabricated blocks that you can assemble yourself.

KitKraken Kitchen fronts

Engineered stone fronts perfectly complement the interior of the kitchen. The first prototypes were made and product tests are being conducted. Production is scheduled for early 2020

Ready to launch

For the first time, prototypes of sinks were shown to the audience at the International Exhibition "Furniture-2018" in Moscow in November 2018. At the moment, our intellectual work is officially patented. A patent was received for the utility model of the shape of a pentagonal bowl No. 188037 dated February 13, 2019.

Now the collection of sinks is undergoing final preparation for launch on the market: the development of packaging design, the formation of sales policy, the development of a website.

About Us

PM-COMPOSITE is a Russian company specializing in the manufacture of products from composite materials according to modern technology. We research the market and select niches where our vision, knowledge and equipment can be applied best.
